Tasks To Be Performed:

1. Deploy 2 VMs with Ubuntu and Apache2 installed
2. Change index.html to include the following text
   a. “This is VM1” on VM1
   b. “This is VM2” on VM2
3. Create a load balancer which will balance the traffic between these two VMs

Add frontend IP configuration

mylb07jan

Name * new-ip

IP version: IPv4 / IPv6

IP type: IP address / IP prefix

Add a public IP address

Name * new-ip

SKU Standard

Tier Regional

Static IPs are assigned at the time the resource is created and released when the resource is deleted. Dynamic IPs are assigned when associating the IP to a resource and is released when you stop, restart, or delete a resource. Dynamic is only available for Basic SKU.

Assignment: Dynamic / Static

Availability zone * Zone-redundant

Routing preference: Microsoft network / Internet

Basics | Frontend IP configuration | Backend pools | Inbound rules | Outbound rules | Tags | Review + create

A backend pool is a collection of resources to which your load balancer can send traffic. A backend pool can contain virtual machines, virtual machine scale sets, and containers.

+ Add a backend pool

Name	Virtual network	Resource Name	Network interface	IP address	Availability zone	Admin state
pool1						
pool2						
pool2	myubyntuvmjan06-vnet	vm2	vm2719_z2	10.0.0.5	2	None
