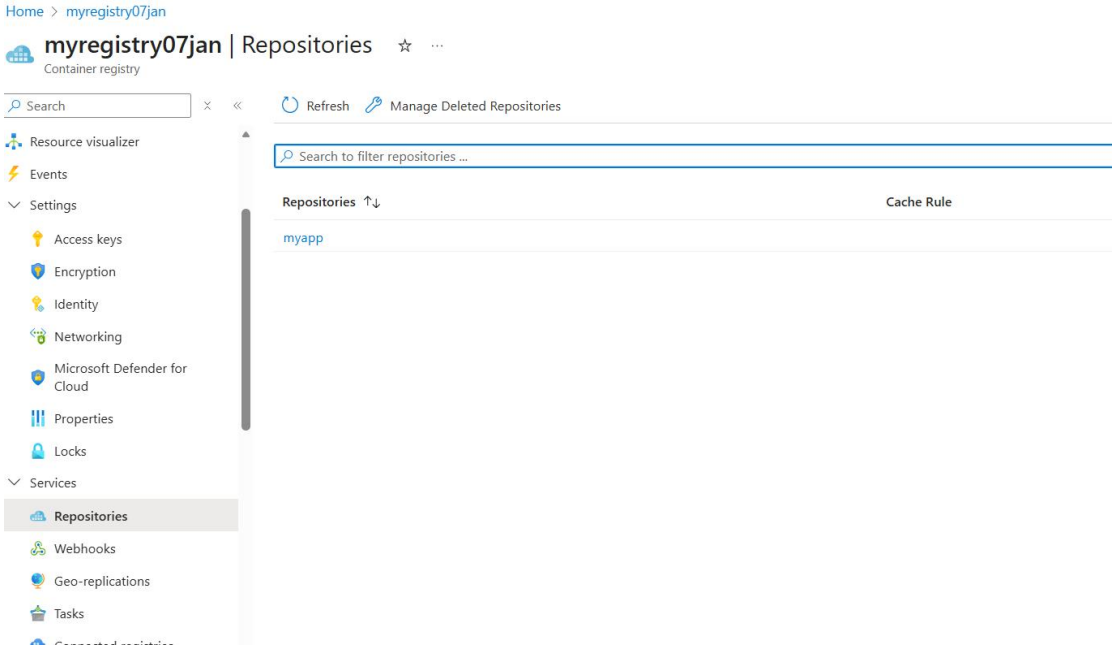
Tasks To Be Performed:

1. Create an Azure Container Registry and connect it to Docker running in VM
2. Upload the image you created in this Azure to container registry
3. Create an app service to deploy the same image

---

1. Create an Azure Container Registry and connect it to Docker running in VM



2. Upload the image you created in this Azure to container registry

```
azureuser@vm07jan:~$ sudo docker commit 65b6bfeb30fb myregistry07jan.azurecr.io/myapp
sha256:9e9a97377879ba69f506fd4eef2189edfe97a6f6011b8723991f8d3b99cb26f1
azureuser@vm07jan:~$ sudo docker images
REPOSITORY                          TAG       IMAGE ID       CREATED         SIZE
myregistry07jan.azurecr.io/myapp    latest    9e9a97377879   9 seconds ago   303MB
hshar/webapp                        latest    0cbc1f535ed8   6 years ago     303MB
azureuser@vm07jan:~$
```

```
azureuser@vm07jan:~$ sudo docker push myregistry07jan.azurecr.io/myapp
Using default tag: latest
The push refers to repository [myregistry07jan.azurecr.io/myapp]
